Fast spreading malware costs school district valuable time and money

Challenges

- IT was receiving a lot of calls about slow computers and odd system behaviors
- Antivirus software was missing a large number of antivirus threats
- Technicians had to travel across the school district to visit the infected devices and run manual scans
- Phishing schemes would spread malware to system directories and continuously replicate itself

Reasons for Choosing Malwarebytes

- Centralized console: Malwarebytes’ centralized system makes it easy for admin to manage systems and monitor threats.
- User-friendly: Malwarebytes Endpoint Protection was easy to deploy with a simple and clean interface.
- Remote access: Malwarebytes’ cloud-based solution allows technicians to look into the systems without having to travel to do a manual scan.
- Small footprint: Malwarebytes functions silently in the background without affecting users’ devices.

How Malwarebytes Solved the Problem

- Reduced malware-related calls to zero
- Regained hours of time for technicians
- Gained deep visibility into endpoints and types of malware targeting the district
- Valuable data is easily accessible from the cloud and a report can be generated at anytime
Calls from teachers and staff have gone to pretty much zero. Malwarebytes works in the background to stop malware without affecting users. We always can see when it quarantines threats before they have the chance to disrupt a system.
